FutureMe Lab

Test-drive a career before choosing it

A career discovery lab for students

Product pitch and school pilot proposal

The career choice gap

“I want to be a software engineer.”

What does the student enjoy about the work?

A title offers limited evidence

Aspirations can reflect familiarity, prestige, or what students have heard.

An experiment adds context

A short task makes reasoning, enjoyment, and support needs visible.

A discovery loop built around action

01

Explore interests

50 questions surface promising directions.

02

Try the work

A guided mission presents a realistic problem.

03

Review evidence

Feedback explains what the student did.

04

Choose an experiment

A practical next step keeps discovery moving.

The working MVP

50

Multiple-choice questions

6

Career interest areas

3

Interactive missions

1

Personal discovery journal

Grade or age setup with saved progress and personalized next steps

Three jobs students can try today

Career mission	The miniature job	Learning level
Software development	Fix a registration rule and choose boundary tests	Grade 7+ / age 12+
Product design	Improve a confusing bus booking flow	Grade 6+ / age 11+
Business analysis	Investigate café sales and propose an experiment	Grade 9+ / age 14+

Students can browse every level. Their saved grade or age controls which missions open.

Same ambition, different strengths

ALEX: THE DEBUGGER

Tests the boundary

Checks 29, 30, and 31 registrations before trusting the fix.

NEXT EXPERIMENT

Debug a failure with several plausible causes.

SAM: THE DESIGNER

Sees the confusion

Notices the error message gives students no useful next action.

NEXT EXPERIMENT

Design and test a clearer recovery message.

Feedback a student can point to

“You selected tests on both sides of the capacity boundary.”

Evidence: the student chose 29, 30, and 31 as test cases.

Next stretch: explain which new evidence would change the solution.

The questionnaire starts the exploration

Product layer	Signal it captures	How students use it
Interest explorer	What sounds engaging	Choose a direction to try
Career mission	Choices and reasoning	See evidence from the task
Reflection and plan	Enjoyment and next questions	Decide what to try next

The combination turns a career suggestion into a testable next step.

A clear boundary between today and next

WORKING TODAY

Transparent feedback

Authored rubrics connect feedback to task choices. Enjoyment stays separate.

Simple local progress

Answers stay in the browser. The MVP needs no student account.

PLANNED AFTER PILOT

AI-assisted feedback

A future backend could explain richer student work using reviewed rubrics.

School support

Explore consent, account access, educator review, and school reporting.

A school-first route to adoption

INITIAL USERS

Students exploring subject and career choices

Entry point

A counselor-led career discovery session with a short debrief.

Revenue hypothesis

School licenses for mission libraries and educator tools. Validate pricing in pilots.

Proposed buyer: schools and career guidance programs

The pilot measures discovery

PROPOSED SUCCESS TARGETS, NOT RESULTS

70%

Finish their first mission

50%

Voluntarily start a second

80%

Say feedback describes what they did

Also ask: “What did you learn about yourself, and what will you try next?”

A focused path beyond the MVP

NOW

Working prototype

50 questions, three missions, eligibility filters, profile and journal.

NEXT

School pilot

Observe completion, review feedback, and improve confusing tasks.

THEN

Deeper simulations

Add open-ended work, more career missions, and reviewed AI support.

The next step: a school pilot

2 schools. 40 students.
One useful next experiment.

Proposed pilot: supervised sessions, an educator review,
and one follow-up conversation about what students learned.
